Report Overview

Glasses-free 3D grating film is a type of optical film that is used to create 3D visual effects without the need for special glasses or headsets. The film consists of a series of microstructures or gratings that diffract light in a way that creates the illusion of depth and dimensionality. When placed over a flat display screen, the grating film can split the light into multiple views, allowing each eye to see a slightly different image, which the brain integrates to create a 3D image. The grating film can be applied to various display technologies, such as LCD, OLED, or LED screens, and can be used in a range of applications, including advertising, gaming, and entertainment. It offers a more convenient and cost-effective solution for creating 3D effects compared to traditional 3D glasses or headsets.
