## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Glassforming Aprons competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of glass fiber molded aprons is 1.97 million pieces, with an average selling price of US\$78 per piece. Glassforming aprons are critical contact components used in the glass fiber production process. They are primarily installed in the sizing impregnation system to guide and stabilize high-speed glass fiber strands while ensuring uniform sizing. They are typically made of high-performance elastomers, offering excellent wear and corrosion resistance and wettability. During the spinning process, these aprons come into direct contact with the glass fiber filaments, controlling fiber tension, guiding path, and surface treatment, significantly influencing the final fiber's physical properties (such as hairiness, breakage rate, and loss on ignition). Their surface roughness, hardness, and elastic modulus must be precisely controlled to accommodate glass fiber products of varying counts and sizing types.

The global Glassforming Aprons market size was estimated at USD 154.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
