Abstracts

Glassy carbon electrodes are specialized electrochemical sensors composed of a non-graphitizing carbon material that exhibits high purity, impermeability to gases, and excellent chemical inertness across a wide range of temperatures and corrosive environments. This material is characterized by its glass-like, isotropic structure, which provides low electrical resistivity, high hardness, and a smooth surface ideal for precise electrochemical measurements. Unlike graphite or other carbon allotropes, glassy carbon is produced through the controlled pyrolysis of certain polymer resins, resulting in a dense, homogeneous electrode material with minimal porosity and highly reproducible electrochemical behavior. These properties make it particularly suitable for applications requiring stable and reliable performance in analytical techniques such as voltammetry, amperometry, and biosensing, where electrode fouling, background current, and signal-to-noise ratio are critical factors.

The global Glassy Carbon Electrodes market size was estimated at USD 185.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
