Abstracts

Glaucoma drainage implants, also known as aqueous shunts or glaucoma drainage devices, are specialized medical implants designed to lower intraocular pressure in patients with refractory glaucoma that has not responded adequately to conventional treatments like medications or trabecular surgeries. These devices consist of a small silicone or polypropylene tube inserted into the anterior chamber of the eye, which connects to an endplate or reservoir positioned on the sclera; this plate facilitates the controlled drainage of aqueous humor into a subconjunctival space, where it is absorbed, thereby reducing pressure and preventing further optic nerve damage. They are typically reserved for complex cases, including neovascular glaucoma, uveitic glaucoma, congenital glaucoma, and eyes with previous failed filtration surgeries, offering a crucial surgical option when standard interventions are insufficient to halt disease progression.

The global Glaucoma Drainage Implant market size was estimated at USD 360.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
