Report Overview:

Glycated hemoglobin is a form of hemoglobin that is measured primarily to identify the three-month average plasma glucose concentration. The test is limited to a three-month average because the lifespan of a red blood cell is four months (120 days). However, since red blood cells do not all undergo lysis at the same time, HbA1C is taken as a limited measure of three months. It is formed in a non-enzymatic glycation pathway by hemoglobin's exposure to plasma glucose.

The Global Glycated Hemoglobin Testing Market Size was estimated at USD 332.13 million in 2023 and is projected to reach USD 498.44 million by 2029, exhibiting a CAGR of 7.00% during the forecast period.
