Abstracts

Glycol dehydration units are specialized industrial systems designed to remove water vapor from natural gas streams, employing a liquid desiccant, typically triethylene glycol (TEG), which has a high affinity for water absorption; these systems operate through a continuous cycle where wet gas is contacted with lean glycol in an absorber tower, the water-rich glycol is then regenerated by heating to boil off the absorbed water, and the dried gas meets pipeline specifications to prevent hydrate formation, corrosion, and measurement inaccuracies during transmission and processing.

The global Glycol Dehydration Units market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
