Report Overview

Gold-198 seeds are used in permanent seed implant therapy involving injecting approximately 30-100 radioactive seeds into the prostate gland. They give off their radiation at a low dose rate over several weeks, and then the seeds can remain in the prostate gland permanently. Brachytherapy can be used for a wide range of prostate stages, PSA values, and tumor grades. The components and dosages are modified for those with low, intermediate, or high risk prostate cancer. This treatment can also be used for many tumors which are considered too advanced for radical prostatectomy. As long as there is no obvious spread to distant areas of the body, like the bones, this treatment may be considered. For early stages, treatment may be an alternative to the radical prostatectomy, but with less side effects.
