Report Overview

Electroplating refers to the process of electroplating metal ions from the electroplating solution onto the surface of a wafer to form metal interconnects during chip manufacturing. With the development of technology in the chip manufacturing industry, interconnects within chips have shifted from traditional aluminum materials to copper materials, and the market demand for semiconductor copper plating equipment is increasing. At present, semiconductor electroplating has a wide range of applications, including the deposition of copper wires, nickel, gold, and tin silver alloys, but mainly the deposition of metallic copper. Copper wires can reduce interconnection impedance, reduce power consumption and cost of devices, and improve chip speed, integration, device density, etc.
