Abstracts

Gold flotation concentrate is a mineral product obtained through the froth flotation process, a method widely used in mining to separate and concentrate valuable minerals. In this case, gold is separated from ore by exploiting differences in their hydrophobicity. The resulting concentrate, which contains a significantly higher proportion of gold than the original ore, often appears as a fine, dark powder or slurry and typically requires further processing, such as smelting or leaching, to extract pure gold. This intermediate product is critical in the gold production chain, as it enables more efficient handling, transportation, and downstream refining of gold-bearing material, reducing both volume and processing costs for mining operations.

The global Gold Flotation Concentrate market size was estimated at USD 1800.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
