Report Overview

Gold plated tungsten wire refers to a tungsten wire with a layer of gold plating on its surface. It is usually made up of several steps: Surface treatment: The first step is to treat the surface of the tungsten wire to remove impurities and form a smooth base. Copper plating: Next, a layer of copper is electroplated onto the surface of the tungsten wire to increase the surface roughness for better adhesion of gold in the next step. Cleaning: After the copper layer is formed, the surface needs to be cleaned to remove oxide and other impurities so that subsequent metal deposition can be uniform and have good adhesion. Gold plating: A thin layer of gold is deposited on the surface of the copper layer through electroplating or chemical reduction methods, forming a beautiful and corrosion-resistant gold-plated tungsten wire. Drying: The produced gold plated tungsten wire needs to be dried to achieve the desired hardness and strength, and ensure that the plating layer is fully cured. Gold plated tungsten wire has excellent electrical conductivity and high corrosion resistance, and is widely used in high-end lighting, electronic components, and other fields.
