Abstracts

A General Purpose Graphics Processing Unit (GPGPU) is a specialized hardware architecture that repurposes the highly parallel computational capabilities traditionally used for rendering graphics to accelerate a diverse range of non-graphics, data-intensive applications. Unlike CPUs optimized for sequential processing, GPGPUs consist of thousands of smaller, efficient cores that excel at performing simultaneous calculations on large datasets, making them particularly well-suited for tasks requiring massive parallelism, such as machine learning model training, scientific simulations, financial modeling, and video encoding. This architecture leverages frameworks like CUDA and OpenCL to allow developers to write programs that offload computationally heavy workloads from the CPU to the GPU, thereby achieving significant performance improvements in fields where processing speed and throughput are critical.

The global Gpgpu (General Purpose Gpu) market size was estimated at USD 19500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 25.50% during the forecast period.
