### Report Overview

A GPIO expander is a device that enables designers to implement additional inputs and outputs (I / O) on a microprocessor (MPU) or microcontroller (MCU) system. They have an efficient data bus interface to reduce the I / O requirements of the MPU or MCU. This is usually a synchronous serial interface, such as SPI or I2C. They enable designers to incorporate more I / O in a system than the capacity available on the processor device the designer is using. They also enable the I / O to be physically located in a system separate from the processor, facilitating printed circuit board layout and improving signal integrity.
