Report Overview

GPS Anti-Jamming protects GPS receivers from interference and intentional jamming. By the time the GPS signal reaches the Earth's surface is weak and is susceptible to being overcome by higher power Radio Frequency (RF) energy. Even a small jammer of about 10 Watts power can disrupt an unprotected C/A Code receiver for about 30 kilometers (line of sight). GPS Anti-Jamming uses power minimization to reduce the effect of interference and jamming so that the GPS receiver can continue to operate correctly. GPS technology has revolutionized modern warfare. Military organizations regularly depend on satellite technology for accurate positioning, timing and communications. But GPS signals received on Earth are weak and susceptible to interference and intentional jamming. Indeed, the signals are usually obscured by thermal noise and only observable with a tuned signal analyzer - in other words a GPS receiver. A simple low power jammer, readily available via the World Wide Web, can overpower GPS signals within a large area, denying a position solution and timing. Anti-jam systems are mainly used for land, sea, air (including unmanned aerial systems) in the military field.

The global GPS Anti-Jamming market size was estimated at USD 4691 million in 2023 and is projected to reach USD 6283.02 million by 2032, exhibiting a CAGR of 3.30% during the forecast period.

North America GPS Anti-Jamming market size was estimated at USD 1292.47 million in 2023, at a CAGR of 2.83% during the forecast period of 2024 through 2032.
