Abstracts

A gradient magnetometer UAV refers to an unmanned aerial vehicle (UAV) equipped with a gradient magnetometer system, which measures spatial variations in the Earth's magnetic field by using multiple magnetometers placed at fixed distances along the platform. This configuration allows for the detection and mapping of localized magnetic anomalies with high resolution and accuracy, as the gradient measurement effectively cancels out regional magnetic noise and diurnal variations. Such systems are particularly valuable in geophysical exploration, archaeological surveys, UXO (unexploded ordnance) detection, and mineral prospecting, where precise magnetic gradient data?rather than total field measurements?are required to identify subsurface features or objects with greater sensitivity and reduced interference from background magnetic fields.

The global Gradient Magnetometer Uav market size was estimated at USD 120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
