## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Grafting-onto Copolymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Grafting-onto copolymers are a type of graft copolymer synthesized through a method where preformed polymer side chains are chemically attached to a pre-existing polymer backbone via reactive functional groups. This approach, known as the grafting-onto technique, contrasts with other methods like grafting-from (where side chains grow from initiation sites on the backbone) and grafting-through (where macromonomers are polymerized with monomers). In the grafting-onto process, the backbone and the side chains are usually synthesized separately and then covalently linked through coupling reactions, such as click chemistry, esterification, or amidation. This method allows precise control over the molecular weight and composition of both components, enabling the design of advanced materials with tailored functionalities, such as stimuli-responsive behavior, improved compatibilization in blends, and enhanced interfacial properties. Applications span diverse sectors including drug delivery, nanocomposites, surface coatings, adhesives, and compatibilizers in polymer blends.

The global Grafting-onto Copolymers market size was estimated at USD 2385.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
