Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Grafting-through Copolymers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Grafting-through copolymers are a class of graft copolymers synthesized using a polymerizable macromonomer that becomes part of the polymer backbone during polymerization. In this method, the "grafts" (side chains) are preformed polymer chains with polymerizable end groups—often vinyl or methacrylate—which are then copolymerized with other monomers. This contrasts with "grafting-from" or "grafting-onto" techniques, where the side chains are either grown from or attached to an existing backbone. The grafting-through approach allows for precise control over grafting density, side chain length, and polymer architecture, often resulting in comb-like or bottlebrush structures. These copolymers are particularly valued for their tunable physical properties, including viscosity, elasticity, and phase behavior, and are used in applications such as drug delivery, surface coatings, lubricants, and advanced nanostructured materials.

The global Grafting-through Copolymers market size was estimated at USD 1438.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
