Abstracts

Grain fermentation booster enzyme refers to a class of enzymes that accelerate the fermentation process of grains. During grain fermentation, these enzymes break down large molecules such as starch and protein in grains into small molecules like glucose and amino acids that can be utilized by microorganisms. These small molecules not only provide necessary nutrients for the growth and reproduction of microorganisms but also promote the production and quality improvement of fermentation products. The use of grain fermentation booster enzymes can significantly increase fermentation efficiency, shorten fermentation cycles, and improve the flavor and taste of fermentation products.

The global Grain Fermentation Booster Enzyme market size was estimated at USD 1033.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
