Report Overview

Grain-oriented electrical steel (GOES) is a specialized type of cold-rolled silicon steel designed with a highly controlled grain structure that aligns in a specific direction to optimize magnetic properties, particularly in the direction of rolling. This unique microstructure minimizes core losses and enhances magnetic permeability, making it indispensable for high-efficiency electrical transformers, reactors, and other energy conversion equipment. The material's high silicon content (typically 3?3.5%) further reduces eddy current losses, ensuring superior performance in alternating current (AC) applications. GOES is categorized by thickness (commonly 0.23mm, 0.27mm, or 0.30mm) and graded based on core loss values (e.g., M0X series per IEC standards), with premium grades like Hi-B and laser-scribed variants offering ultra-low losses for advanced energy-saving applications. Its production involves complex metallurgical processes, including hot rolling, cold rolling, and decarburization annealing, followed by high-temperature annealing with a nitride coating to stabilize magnetic domains. The material's directional grain alignment, achieved through secondary recrystallization, distinguishes it from non-oriented electrical steel, which has isotropic magnetic properties. As a critical component in power infrastructure, GOES demand is closely tied to energy efficiency regulations, grid modernization, and renewable energy integration, with global supply dominated by a handful of specialized manufacturers due to high technical barriers and capital-intensive production.

The global Grain Oriented Electrical Steel market size was estimated at USD 8253.33 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.17% during the forecast period.
