Abstracts

Grain refiners and modifiers are metallurgical additives used primarily in the aluminum, magnesium, and steel industries to control and improve the microstructure of metals during solidification. These materials, typically in the form of master alloys or salts, introduce nucleating agents or alloying elements that promote the formation of finer, more uniform grain structures, thereby enhancing mechanical properties such as strength, toughness, ductility, and corrosion resistance while reducing defects like hot tearing and porosity. By optimizing grain size and distribution, these modifiers play a critical role in improving the castability, workability, and overall performance of metal products across various manufacturing processes, including casting, extrusion, and forging.

The global Grain Refiner And Modifier market size was estimated at USD 375.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
