Abstracts

Gram-negative infections are caused by a group of bacteria characterized by their cell wall structure, which includes an outer membrane that contributes to their resistance to many antibiotics; these pathogens—such as *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, and *Acinetobacter baumannii*—are responsible for a wide range of serious healthcare-associated and community-acquired infections, including urinary tract infections, pneumonia, bloodstream infections, and intra-abdominal infections, posing significant challenges due to their increasing multidrug resistance and associated morbidity and mortality. The market for Gram-negative infections encompasses diagnostics, therapeutics, and prevention strategies, driven by the rising incidence of antibiotic-resistant strains, growing global healthcare expenditure, heightened awareness of antimicrobial resistance, and ongoing research and development efforts aimed at novel antibacterial agents, vaccines, and rapid diagnostic tools to address unmet medical needs and improve patient outcomes. Key players include pharmaceutical companies developing new antibiotics and combination therapies, diagnostic firms advancing molecular and phenotypic testing platforms, and public health organizations focused on infection control and stewardship programs, with market growth further influenced by regulatory incentives, such as the Generating Antibiotic Incentives Now (GAIN) Act, and global initiatives like the WHO's Global Action Plan on Antimicrobial Resistance.

The global Gram Negative Infections market size was estimated at USD 12500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
