Abstracts

Crumb rubber is made by reducing scrap tires into small, uniform granules. Inherent reinforcing materials of scrap tires, such as steel and fiber, are removed, along with other types of inert contaminants such as dust, glass, and rock. Crumb rubber is used in various applications in rubber flooring, removable speed bumps, and athletic surfaces, including playgrounds, sports courts, and athletic turfs. Crumb rubber adds characteristics that improve the properties of finished products. It also helps lower costs by replacing more expensive virgin compounds. Two major technologies for producing crumb rubber are ambient mechanical grinding and cryogenic grinding. Of the two processes, cryogenic process is more expensive, but it produces smoother and smaller crumbs. The global chemical industry is part of the global economic development, and the cyclical economic development envelopes the global chemical industry. In recent years, global economic growth has slowed down, and the growth rate of the chemical industry has also gradually slowed down. The development of emerging economies such as China and India has continued to promote the global chemical industry to maintain a certain development trend in the past few years. In the future, these economies will continue to drive the chemical industry market forward with their large population base and strong domestic demand growth. In addition to the influence of the geopolitical characteristics of the Middle East, the shale gas industry in the United States among developed countries has become the biggest variable in recent years, driving the strong development of the U.S. chemical industry.

The global Granular Rubber market size was estimated at USD 1575.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
