Abstracts

Graphene and 2D materials refer to a class of atomically thin substances, typically one to a few atomic layers thick, with graphene—a single layer of carbon atoms arranged in a hexagonal lattice—serving as the most prominent example. These materials are characterized by unique and often extraordinary physical, chemical, electrical, thermal, and mechanical properties, such as high electrical conductivity, exceptional strength, flexibility, and optical transparency. Beyond graphene, the category includes other monolayer or few-layer materials like transition metal dichalcogenides (e.g., molybdenum disulfide), hexagonal boron nitride, phosphorene, and MXenes, each offering distinct functionalities suited to various technological applications. The defining feature of this product group is their two-dimensional nature, which enables novel phenomena not observed in their bulk counterparts, driving innovation across electronics, energy storage, composites, sensors, and biomedical devices.

The global Graphene And 2D Materials market size was estimated at USD 380.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 24.50% during the forecast period.
