Report Overview

It exhibits exceptional electronic, mechanical and thermal properties which are expected to increase its use as major filling agents in composite applications. Graphene composites at low loadings exhibit substantial enhancements in multifunctional aspects in comparison to conventional composites & their materials. It also increases the physiochemical qualities of the host matrix/material upon distribution. Graphene based polymer composites exhibits superior thermal, mechanical, gas barrier, flame retardant, and electrical properties in comparison to a conventional polymer. Its involvement in the host matrix improves electrical & mechanical properties better than other nanocomposites such as clay and carbon nanotubes (CNT). Although CNTs are comparable in mechanical properties to that of graphene, still the later is preferable over the former owing to better electrical and thermal conductivity. Graphene nanocomposites market comprises of polymer system such as polystyrene, polystyrene sulfonate, polymethyl methacrylate (PMMA), polyimide, polyethylene terephthalate (PET), epoxy, polyaniline, polyvinylidene fluoride (PVDF), polyurethane (PU), polycarbonate and polyethyldioxythiophene. Situ intercalative polymerization, solution intercalation and melt intercalation are there methods for incorporating polymer in host layered materials.
