Report Overview

Graphene powder is a form of graphene, a single layer of carbon atoms arranged in a two-dimensional hexagonal lattice, processed into a fine particulate form for ease of handling and integration into various applications. Unlike graphene films or sheets, graphene powder consists of stacked or agglomerated graphene layers, often exhibiting properties such as high surface area, electrical conductivity, thermal conductivity, and mechanical strength, though typically to a lesser degree than single-layer graphene due to interlayer interactions. The powder form is widely used in composites, coatings, energy storage (batteries and supercapacitors), conductive inks, and additive manufacturing due to its dispersibility and compatibility with bulk material processing. The quality and performance of graphene powder depend on production methods such as chemical exfoliation, mechanical exfoliation, or chemical vapor deposition as well as post-processing techniques to reduce defects and improve purity. Its commercial viability hinges on balancing cost, scalability, and functional performance for specific industrial applications.

The global Graphene Powder market size was estimated at USD 409.95 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 28.50% during the forecast period.
