Report Overview:

Graphene solar cells are next-generation solar cells that incorporate graphene, a single layer of carbon atoms arranged in a two-dimensional honeycomb lattice. Graphene has incredible properties, such as high electrical conductivity, flexibility, transparency, and a large surface area, which make it an ideal material for solar cell applications.

In a graphene solar cell, a thin layer of graphene is typically used as a transparent electrode or a charge transport layer. This allows for efficient light absorption and collection of generated electrical charges. Graphene's high electrical conductivity helps to transport electrons quickly, reducing energy losses and enhancing the overall efficiency of the solar cell.

Graphene solar cells have the potential to overcome the limitations of traditional silicon-based solar cells. They can be manufactured using low-cost and scalable production methods, making them more economically viable. Additionally, their flexibility and transparency enable their integration into a wide range of applications, including wearable electronics, building-integrated photovoltaics, and portable devices.

The Global Graphene Solar Cell Market Size was estimated at USD 472.97 million in 2023 and is projected to reach USD 899.08 million by 2029, exhibiting a CAGR of 11.30% during the forecast period.
