Report Overview

Graphene photovoltaic cells, also known as organic solar cells, are solar cells that are wholly or partly organic, and they use conductive polymers or small molecules for light absorption and charge transfer. The large-scale preparation, relatively low price, and softness of organics make them promising for photovoltaic applications. The energy gap of organic molecules can be changed by changing the length and functional groups of molecules such as polymers. The molar extinction coefficient of organic substances is very high, so that a small amount of organic substances can absorb a large amount of light.
