Abstracts

Graphite conductive adhesive is a specialized type of electrically conductive adhesive (ECA) formulated with graphite as the primary conductive filler, dispersed within a polymer matrix—typically epoxy, silicone, or acrylic—to provide both electrical conductivity and mechanical bonding properties. Unlike metal-filled alternatives such as silver or copper-based adhesives, graphite variants offer a balance of moderate conductivity, cost-effectiveness, and corrosion resistance, making them suitable for applications where high-performance conductivity is not critical but stability and affordability are prioritized. These adhesives function by forming percolation networks through which electrons travel, enabling their use in electronic assembly, photovoltaic cell interconnections, printed electronics, electromagnetic interference (EMI) shielding, and flexible circuitry, where they provide reliable electrical pathways while adhering to diverse substrates including plastics, ceramics, and metals.

The global Graphite Conductive Adhesive market size was estimated at USD 185.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
