### Report Overview

Graphite Granular and Powder refers to two distinct forms of graphite, a naturally occurring form of crystalline carbon. Graphite is known for its unique properties, such as electrical and thermal conductivity, lubrication capabilities, and chemical inertness. Graphite Granular typically consists of larger, coarser particles of graphite, which are often used in applications requiring a granular form, such as in metallurgy, as a refractory material, or in certain types of batteries. On the other hand, Graphite Powder is made up of fine, powdered particles that are used in a variety of industrial and manufacturing processes. These include the production of lubricants, coatings, and as a component in various composite materials. Both forms are valued for their ability to conduct electricity and heat, as well as their resistance to corrosion, making them essential in a wide range of industries from automotive to electronics.
