Abstracts

Graphite monochromators are specialized optical components used primarily in X-ray diffraction (XRD) and X-ray fluorescence (XRF) instrumentation, designed to select and direct a specific wavelength of X-rays by exploiting the crystallographic properties of highly oriented pyrolytic graphite (HOPG). These devices function based on Bragg's law, utilizing the graphite crystal's layered structure to diffract X-rays at precise angles, thereby isolating monochromatic radiation essential for high-resolution analysis in materials science, geology, pharmaceuticals, and quality control applications. Their performance is characterized by high reflectivity, thermal stability, and tunability, making them critical for enhancing signal-to-noise ratios and analytical accuracy in both laboratory and industrial X-ray systems.

The global Graphite Monochromators market size was estimated at USD 152.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
