Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Grass-fed Chicken competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Grass-fed chicken refers to poultry raised primarily on natural pasture, where chickens forage freely for grass, seeds, herbs, and insects, often supplemented with minimal non-GMO or organic grains. Unlike conventional poultry production systems that rely heavily on confined feeding operations, grass-fed chicken emphasizes open grazing, animal welfare, and ecological balance. The term "grass-fed" in the context of poultry indicates not only a natural diet but also a production system that allows birds to express natural behaviors such as pecking, scratching, and foraging. This farming method results in meat that is typically leaner, richer in omega-3 fatty acids, and more flavorful due to the varied pasture diet. Additionally, grass-fed chickens are often raised without antibiotics, synthetic growth promoters, or genetically modified feeds, making them appealing to consumers seeking clean-label and ethically sourced protein options. From a market development perspective, the grass-fed chicken segment represents a significant shift toward sustainable and transparent food systems. Consumers are increasingly conscious of how their food is produced, prioritizing health, environmental responsibility, and animal welfare. This awareness has driven the demand for naturally raised poultry, positioning grass-fed chicken as a premium alternative to industrially farmed meat. Producers are responding by adopting rotational grazing systems, regenerative agricultural practices, and traceable supply chains to differentiate their offerings. These methods not only improve soil health and reduce the carbon footprint but also enhance the nutritional quality of the final product. In 2024, global Grass-fed Chicken production reached approximately 28.2 K MT, with an average global market price of around US\$ 25.3 per kg. The global single-line

production capacity ranges from 3 to 5 K MT per year. The industry's gross profit margin is approximately 30%-35%.

The global Grass-fed Chicken market size was estimated at USD 714.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.00% during the forecast period.
