Report Overview

Grass pellet fuel is a type of biomass fuel made from compressed dried grass, such as hay, straw, or other agricultural residues, processed into small cylindrical pellets typically measuring 6?10 mm in diameter. It is considered a sustainable and renewable energy source, offering an eco-friendly alternative to traditional fossil fuels like coal and natural gas, as well as wood pellets. Grass pellets are primarily used for heating residential, commercial, and industrial spaces through pellet stoves, boilers, and combined heat and power (CHP) systems. The production process involves harvesting, drying, grinding, and compressing grass into dense pellets with low moisture content, ensuring efficient combustion and high energy output. Due to its carbon-neutral properties?absorbing CO? during growth and releasing it when burned?grass pellet fuel aligns with global decarbonization efforts and circular economy principles. However, challenges such as supply chain logistics, storage stability (due to higher ash content compared to wood pellets), and competition with other biofuels may influence market adoption.

The global Grass Pellet Fuel market size was estimated at USD 1186.54 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
