Abstracts

Grass reinforcement grids, also known as turf or grass protection grids, are three-dimensional, honeycomb-like cellular confinement systems made from durable, permeable materials?typically recycled plastics like HDPE or polypropylene?designed to stabilize soil, reinforce grass surfaces, and prevent erosion while allowing natural vegetation to grow through the open cells. These systems function by distributing loads evenly across the surface, making them particularly effective in high-traffic areas such as parking lots, fire access roads, embankments, and recreational spaces, where they combine environmental benefits like stormwater management and groundwater recharge with the structural integrity needed to support vehicles and heavy foot traffic without compromising the green, natural appearance of the area.

The global Grass Reinforcement Grids market size was estimated at USD 175.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
