## Abstracts

The gravity sensor is made of a cantilever-type displacement device using elastic sensitive elements, and an energy storage spring made of elastic sensitive elements is used to drive electrical contacts to complete the conversion from gravity changes to electrical signals. The gravity sensor works according to the principle of the piezoelectric effect. The so-called piezoelectric effect is "For an heteropolar crystal that does not have a symmetric center, the external force added to the crystal will not only deform the crystal, but also change the polarization state of the crystal. In the crystal, an electric field is established. This phenomenon of the polarization of the medium due to the mechanical force is called the positive piezoelectric effect.

The global Gravity Sensor market size was estimated at USD 78.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.40% during the forecast period.
