Abstracts

The market for grease filled PC strand, also known as greased prestressing strand or corrosion-protected strand, is a specialized segment within the construction materials industry primarily focused on infrastructure projects requiring enhanced durability and corrosion resistance. This product consists of high-strength steel wires (typically conforming to standards like ASTM A416 or similar) that are twisted together to form a strand, which is then filled with a corrosion-inhibiting grease and sheathed in a protective polymer coating, often polyethylene or polypropylene. The grease acts as a barrier against moisture and aggressive environmental elements, significantly extending the service life of prestressed concrete structures such as bridges, marine platforms, nuclear containment vessels, and large-span buildings where long-term structural integrity under harsh conditions is critical. Its application is essential in environments with high humidity, exposure to deicing salts, or coastal areas where chloride-induced corrosion poses a risk to conventional unprotected strands. The product is defined by its dual-layer protection system—internal grease filling and external sheathing—which distinguishes it from bare or epoxy-coated strands and positions it as a premium solution for demanding engineering applications where safety, longevity, and reduced maintenance are paramount.

The global Grease Filled Pc Strand market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
