Abstracts

Green ammonia production involves synthesizing ammonia (NH₃) through processes powered by renewable energy sources, replacing conventional natural gas-based methods to eliminate carbon emissions. This is achieved by using green hydrogen, produced via water electrolysis with renewable electricity, which is then combined with nitrogen extracted from the air through the Haber-Bosch process or emerging electrochemical pathways. The resulting product serves as a carbon-free energy carrier, fertilizer, and industrial feedstock, positioning green ammonia as a pivotal solution for decarbonizing sectors like agriculture, shipping, and power generation while supporting global energy transition goals.

The global Green Ammonia Production market size was estimated at USD 162.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 71.33% during the forecast period.
