Report Overview

A composite is defined as a multiphase material and composition of material differing in composition, which remain bonded together, but retain their identities and properties, without going to any chemical reaction. Composite is engineered to meet specific application, performance and specific needs. Green composites, also known as bio composites or eco-composites, are composite materials made from renewable resources such as natural fibers and bio-based resins. Green composite combines plant fibers with natural/biodegradable/bio-based resins to create natural composite materials. Biomaterial composites are made from hemp, kenaf, sisal, soybean, etc. Natural fibers are emerging as low cost, lightweight and apparently environmentally superior alternative to synthetic fibers. The resins and fibers used in the green composites are biodegradable, when they dumped, decomposed by the action of microorganisms. They are converted into the form of H₂O and CO₂. These H₂O and CO₂ are absorbed into the plant systems.

The global Green Composites market size was estimated at USD 10650 million in 2023 and is projected to reach USD 23709.97 million by 2032, exhibiting a CAGR of 9.30% during the forecast period.
