Report Overview

Green hydrogen is produced by electrolyzing water through renewable energy such as photovoltaic, wind power and solar power. On the one hand, the production process achieves zero carbon emissions, and on the other hand, it effectively solves the problem of renewable energy consumption with its large-scale, long-cycle and long-distance energy storage advantages. The short-term space for green hydrogen downstream comes from the replacement of gray hydrogen in the chemical industry, and the long-term incremental space comes from the transportation field, natural gas hydrogenation, and hydrogen for steelmaking. It helps reduce carbon in the industrial and transportation fields and is an important carrier of the fourth global energy revolution.

In 2021, the global pure hydrogen production was about 70 million tons, of which green hydrogen accounted for less than 0.1%. With the intensive construction of global wind, solar and hydrogen integrated projects in 2023-2024, the report predicts that the proportion of green hydrogen is expected to reach 2% in 2025 and 30% in 2030.
