Abstracts

Green methane is a type of methane gas that is produced through a process called methanation, which involves the reaction of carbon dioxide (CO₂) and hydrogen (H₂) to produce methane (CH₄) and water (H₂O). This process can be powered by renewable energy sources such as solar, wind, or hydropower, which makes green methane a renewable energy carrier. Green methane has the potential to replace conventional natural gas as a fuel for heating, electricity generation, and transportation. It can also be injected into existing natural gas pipelines and used in industrial processes that require high-temperature heat. Global 5 largest manufacturers of green methane are Clean Energy Fuels, Dominion Energy, Archaea Energy, Montauk Renewables and VERBIO, which make up nearly 40%. Among them, Clean Energy Fuels dominates with nearly 20% production value share, followed by Dominion Energy (10%) and Archaea Energy (6%). North America is the largest market, holding a share nearly 40%, followed by Europe and China, with shares 35% and 10% separately. There are two sources of green methane, including agricultural waste and municipal landfill. The leading source is agricultural waste, with a market share over 50%. In terms of application, ordinary automotive side view mirror is mainly used in electricity generation and vehicle fuel. The largest segment is electricity generation, accounting for nearly 70%.

The global Green Methane market size was estimated at USD 4748.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 17.40% during the forecast period.
