Report Overview

Green methanol is a clean energy source that utilizes renewable energy sources such as solar and wind energy to decompose water into green hydrogen, which is then synthesized by adding carbon dioxide to green hydrogen under the catalytic action. According to a research report by the Global Methanol Association, renewable hydrogen refers to the use of renewable energy to produce hydrogen, while renewable carbon dioxide refers to carbon dioxide from biomass sources or direct air capture of carbon dioxide. In fact, deliberately emphasizing the source of carbon dioxide is not very meaningful at present, because industrial carbon dioxide emissions such as flue gas cannot be blocked in a short period of time. The capture of carbon dioxide by flue gas and direct air capture of carbon dioxide have the same effect on carbon reduction.

The global Green Methanol Synthesis Catalysts market size was estimated at USD 1630 million in 2023 and is projected to reach USD 3340.75 million by 2032, exhibiting a CAGR of 8.30% during the forecast period.

North America Green Methanol Synthesis Catalysts market size was estimated at USD 487.31 million in 2023, at a CAGR of 7.11% during the forecast period of 2024 through 2032.
