### Report Overview

Green petroleum coke is a carbonaceous solid residue produced by the thermal decomposition of petroleum fractions. It has low metal content and is calcined in rotary kilns to form calcined petroleum coke. During the calcination process, green petroleum coke is heated to increase its electrical conductivity and remove volatile matter, moisture, and other impurities. The calcined petroleum coke is further processed to produce carbon anodes in the required shape and physical characteristics by using anode baking ovens. The quality of the calcined petroleum coke plays a key role in the performance and quality of the anodes.
