Abstracts

Grey water scale inhibitor is a chemical additive used to treat grey water. It is mainly used to prevent scaling of equipment and pipes and maintain the normal operation of the system. Grey water usually has the characteristics of high hardness, high turbidity, high alkalinity, etc., which easily forms sediments, scaling and corrosion inside the equipment, thus affecting the normal operation and life of the equipment. Grey water scale inhibitor disperses suspended matter, microcrystals and other particles in the grey water through physical or chemical action to prevent their aggregation and deposition. At the same time, it forms stable complexes with hard water ions such as calcium and magnesium in the grey water to reduce their concentration, thereby inhibiting the formation of hard scale.

The global Greywater Scale Inhibitors market size was estimated at USD 79.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
