## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Grid Booster competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global grid booster production reached approximately 1996 units, with an average global market price of around K US\$ 54 per unit. Grid booster is a high-power energy storage system installed on key nodes of high-voltage transmission network. It compensates line power flow, improves transmission capacity, reduces reserve capacity demand and quickly responds to sudden failures through real-time charging and discharging, thus improving the overall operation efficiency and stability of the power grid. The annual production capacity of a single production line for grid boosters typically ranges from 50 to 100 units, with a gross profit margin of approximately 26%. Downstream consumption of grid boosters is 42% for industrial use, 58% for commercial use.

The global Grid Booster market size was estimated at USD 108.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
