#### **Report Overview**

Grinding robots remove excess material from the surface of machined parts and products quickly and efficiently. These robots save time and production costs while improving the integrity and uniformity of each work piece. Customized end of arm tooling can be fitted to any of these grinding robots to perform the type of grinding required, the right amount of pressure needed and not harm the product. Grinding robots also reduce health risks associated with the metal dust getting in a worker's eyes or lungs during the application process.

The preference for grinding robots is high in comparison to CNC grinding machines due to various advantages such as the ability to grind and manufacture robots and carry out multiple applications such as material handling. The ergonomic benefits due to smaller footprint of a robot and the need for lower investment costs will further boost the adoption of grinding robots over CNC grinding machines. Technavio's market research report identifies the advantages of grinding industrial robots over CNC machines to be one of the primary growth drivers for the global grinding robots market till 2022. The adoption of grinding robots will further increase as unlike CNC grinding machines, grinding robots do not require additional tooling and fixtures.
