Abstracts

Guanidine thiocyanate is a powerful, chaotropic agent which is widely used for purification of proteins and nucleic acids. Guanidine thiocyanate is preferred for the purification of RNA because it dissociates the RNA into its nucleic acids and protein forms and is commonly used in the guanidinium thiocyanate-phenol-chloroform extraction method. As one of the strongest protein denaturants, it inactivates nucleases more than twice as fast as Guanidine hydrochloride. It is useful for denaturation and refolding of proteins. At high molarity solutions, Guanidine thiocyanate irreversibly inactivates RNase. Guanidine thiocyanate causes proteins to dissolve readily, thus disintegrating cellular structures. **Biotechnology and Molecular Biology:** Guanidinium Thiocyanate is widely used in biotechnology for its ability to denature proteins and inactivate nucleases. It is a crucial component in nucleic acid isolation and purification protocols, making it a fundamental reagent in laboratories and research facilities. **Growth in Genetic Research:** The growth of genetic research, genomics, and molecular diagnostics significantly drives the demand for Guanidinium Thiocyanate. Researchers require high-quality and pure nucleic acids for studying genes and genetic disorders. **Pharmaceutical and Drug Development:** Guanidinium Thiocyanate is used in the development and manufacturing of pharmaceuticals, particularly in the purification of nucleic acids for producing therapeutic drugs and biologics.

The global Guanidinium Thiocyanate (GTC) market size was estimated at USD 232.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.40% during the forecast period.
