Abstracts

A rail unloader, typically where each carrier comprises a recirculating rotating member and a plurality of unloading pads, the recirculating rotating member having a plurality of first pad attachment portions in spaced relation in the direction of rotation, the unloading pads being removably attached to the pad attachment portions by sliding the unloading pads in a direction perpendicular to the direction of rotation, said carrier surface being formed by the surface of the unloading pads. Guide rail unloaders provide efficient and controlled unloading, minimizing spillage and optimizing material handling processes.
