Abstracts

Gun-type bipolar electrocoagulation forceps is a medical device commonly used in surgical operations. It is used in conjunction with high-frequency surgical equipment and uses the thermal effect of high-frequency current to perform fine cutting and coagulation operations on tissues during surgery. The shape of the gun-type bipolar electrocoagulation forceps is similar to a pistol, hence the name 'gun-type'. This design facilitates doctors to perform fine operations during surgery. The two electrodes of the gun-type bipolar electrocoagulation forceps are located at the two tips of the forceps. When in use, the high-frequency current flows between the two electrodes, and only produces a thermal effect on the tissue between the tips of the forceps. The protein is coagulated by heating, and the blood vessels are closed to achieve the purpose of hemostasis. At the same time, since the current is limited to the tips of the forceps, the damage to adjacent tissues is small. Gun-type bipolar electrocoagulation forceps are mainly used in fine operations in departments such as neurosurgery, orthopedics, vascular surgery, hepatobiliary surgery, and general surgery. It can perform more fine electrocoagulation hemostasis and treatment on small blood vessels and other structures, and has the functions of separation and clamping.

The global Gun Type Bipolar Electrocoagulation Forceps market size was estimated at USD 210.54 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
