Abstracts

A hairpin heat exchanger is a type of heat exchanger that is designed in a U-shape or hairpin shape. It consists of two parallel tubes connected by a U-bend, forming a hairpin-like structure. The fluid flows through one tube, makes a U-turn at the bend, and flows back through the other tube. Hairpin heat exchangers are commonly used in applications where high heat transfer efficiency is required, such as in HVAC systems, refrigeration systems, and industrial processes. They are particularly suitable for applications with high temperature differentials or where fouling is a concern. The hairpin design allows for a compact and efficient heat transfer process. The U-bend in the middle of the exchanger helps to increase the heat transfer area and promote turbulent flow, which enhances the heat transfer rate. Additionally, the parallel tube arrangement allows for counterflow or crossflow configurations, depending on the specific application requirements. Hairpin heat exchangers can be made from various materials, including metals like stainless steel, carbon steel, or copper, as well as non-metallic materials like plastic or glass. The choice of material depends on factors such as the operating temperature, pressure, and the nature of the fluids being exchanged.

The global Hairpin Heat Exchanger market size was estimated at USD 4898.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
