## Abstracts

A half-bridge gate driver IC is a specialized semiconductor device designed to control the switching of power transistors, typically MOSFETs or IGBTs, in a half-bridge configuration, which consists of two switches connected in series with the output taken from their midpoint. This IC provides critical functions such as level shifting, isolation, and gate driving to ensure efficient and reliable operation in high-voltage applications, including motor drives, switched-mode power supplies, and inverters. By integrating features like under-voltage lockout, dead-time control, and protection mechanisms against overcurrent and short circuits, it enhances system safety and performance while reducing design complexity and component count.

The global Half Bridge Gate Driver Ic market size was estimated at USD 1262.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
