Abstracts

Hall Current Thrusters, also known as Hall-effect thrusters, are a type of electric propulsion system used primarily in spacecraft for orbital station-keeping, attitude control, and interplanetary missions. These devices operate by ionizing a propellant (typically xenon) and accelerating the resulting ions using electric and magnetic fields to generate thrust, offering significantly higher specific impulse compared to traditional chemical propulsion systems, which allows for greater fuel efficiency and extended mission durations. The technology is characterized by its reliance on a cross-field electron discharge to maintain the plasma and its ability to provide continuous, low-thrust acceleration over long periods, making it particularly suitable for applications where precise maneuverability and sustained operation are critical, such as in satellite constellations, deep-space exploration, and scientific missions.

The global Hall Current Thrusters market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
