Abstracts

Hall Effect magnetometers are sensors that detect magnetic fields by utilizing the Hall Effect, a phenomenon that occurs when a current-carrying conductor is placed in a magnetic field. As the magnetic field interacts with the moving charge carriers (electrons or holes) in the conductor, it generates a voltage perpendicular to both the current and the magnetic field. This voltage, known as the Hall voltage, is proportional to the strength of the magnetic field. Hall Effect magnetometers are widely used for measuring magnetic field strength, detecting the presence of magnets, or monitoring current flow in applications such as industrial automation, navigation systems, and scientific research.

The global Hall Effect Magnetometers market size was estimated at USD 372.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.70% during the forecast period.
